

Doors & Monsters Homework

Overview

Your task is to be able to interact with doors and add monsters to the game.

Steps

1. Create an `OpenDoor` action in the files `content/actions/opendoor.{h,cpp}`. The constructor should take in a reference to a `Door` object, i.e. `Door&`.
2. Modify `Move::perform()` so that you return `alternative(OpenDoor{door object})` when the tile you wish to walk to has a door. This allows characters to open doors by simply walking into them.
3. If you haven't already, modify `Move::perform()` to return `Rest` when trying to walk on a tile that has an entity.
4. If you haven't already, bind "C" to the `CloseDoor` action.
5. Make two new monsters (in addition to the one that you made in class). Give them a sprite, set their health, and the default behavior.
6. Modify `main.cpp` so that there are some of each type of monster.

Testing

Ensure the following:

- Walking into a closed door opens it
- Walking into an open door simply moves you to the tile
- Walking into an enemy gives up your turn by resting
- Monsters wander around when not visible (move around the dungeon until you find a monster opening a door)
- Monsters pursue you when they are visible
