

CSC 231: Final Project

Overview

After completing the checkpoints, you should now be familiar with how to extend the game engine to create an interesting game. In particular, you've had practice with

- Actions and how to bind them to key presses or generate them programmatically
- Interacting with the dungeon Tiles, Doors, Entities
- Attacking (Items, Hit event)
- Animation events

The goal for the final project is for you to **add a new and unique feature** to your game. Here are some ideas:

Area of Effect Attack

An attack that damages all entities within a given radius

Ranged attack

Shoot a projectile that Hits entities from a distance

Healing

Pick up an item that can be used to heal yourself

Spawn minions

Create a spell that creates nearby friends that are on your team and attack enemies

Dropping loot

When an entity dies, place its Items on nearby tiles that can be picked up by others

Requirements

Typically a new feature involves **creating a new Action and Event**. If you have another idea that doesn't involve Actions/Events, then you must have approval from me to work on it.

Rubric

Item	Percentage
Runs without error	50%
Proper API usage	30%
Coding style/doc	20%

Runs without error

Does your feature work the way you intended it to? Does it crash?

Proper API usage

Do you use the engine's interface correctly (Events, Actions, calls to Engine components) to make your feature work? OR is it hacked together hastily and held together with duct tape?

Coding style

Do you have a consistent style? Appropriately named variables/functions? Do you have comments explaining the purpose of your code?

You must submit code that compiles in order to receive credit.

You must present your new feature during the final exam slot.
